PROFESSIONAL SUMMARY

Full-stack engineer with 14+ years shipping and operating production web, mobile and platform systems. Recent work spans the whole path: React and React Native clients, Python, Go and Node services, Kafka pipelines on Kubernetes, and the CI/CD and observability that keep them running. Used to being the person who follows a failure from the UI down to the broker, in remote and distributed teams.

TECHNICAL SKILLS

Frontend: React, React Native, Next.js (SSR, SSG, ISR, CSR), TypeScript, JavaScript (ES6+), Material UI, MUI X, Tailwind CSS, shadcn/ui, PrimeReact, Emotion, SASS, design systems, Storybook, PWA, accessibility, Web Vitals

State and APIs: Redux Toolkit, TanStack Query (React Query), SWR, Zustand, GraphQL, Apollo Client, REST, WebSockets (STOMP), offline-first caching

Backend: Python, Django, Node.js, NestJS, Go, PHP, Laravel, event-driven workers, authentication and SSO (Keycloak, OAuth)

Data: PostgreSQL, MySQL, Elasticsearch, Redis, MongoDB, Apache Kafka, Logstash

Cloud and DevOps: Docker, Kubernetes, K3s, Helm, Traefik, GitLab CI/CD, GitHub Actions, AWS (Elastic Beanstalk, EC2, ALB, RDS, S3, CloudFront, ECS, DynamoDB, CloudWatch, AppSync), Google Cloud, Cloudflare

Reliability: Prometheus, Grafana, Alertmanager, Loki, Promtail, Sentry, incident response, root cause analysis, throughput tuning

Testing and practice: Jest, React Testing Library, MSW, Cypress, ESLint, SonarQube, OWASP dependency-check, Git, Git Flow, code review, Agile, Scrum, technical documentation

PROFESSIONAL EXPERIENCE

Senior Full-Stack / Site Reliability Engineer

Netbina | Remote | 2026 – Present

Telescope, a social-listening platform of roughly thirty microservices on a five-node K3s cluster, and SeePlayShow, a live show-control product on AWS.

- Operate Telescope end to end: social and marketplace ingest, Kafka enrichment workers for category, sentiment, topic and near-duplicate detection, PostgreSQL and Elasticsearch storage, a Laravel API and a React panel.
- Replaced tag-based manual releases with branch-driven GitLab CI/CD: a push to master builds a commit-SHA image, pushes it to the private registry and rolls the live Kubernetes Deployment, removing the manual deploy step from every release.
- Hardened the ingest and enrichment path against stalls by adding explicit HTTP timeouts, bounding retries, batching Kafka-to-service writes and raising worker replicas, so one slow upstream can no longer freeze the pipeline.
- Built a Go reverse proxy for Google Gemini that fronts every AI call: shared-token authentication, a sticky API key that rotates on HTTP 429 and resets daily, default-model injection, and IP and domain allowlists, deployed with Docker Compose behind Traefik.
- Built the operator-facing health and superadmin surfaces in React so ingest gaps and content-kind problems are visible before a customer reports them.
- Led the response to a priority-1 outage where self-hosted GitLab returned 404 on every route after a host Docker upgrade broke Traefik's Docker provider: restored routing with a file-based configuration, brought CI runners back online, and wrote the incident report and follow-ups.
- Automated SeePlayShow delivery with GitHub Actions: Django releases to AWS Elastic Beanstalk and Node WebSocket releases to EC2 over rsync and PM2 behind a shared load balancer, across staging and production.

React Native / Full-Stack Engineer

FaraDars | Remote | 2024 – 2026

Mobile client for one of the largest online-education catalogues in the market.

- Shipped the FaraDars learning app through release 2.1.20 on React Native 0.86 and React 19 with TypeScript: course discovery and search, video lessons, downloads and progress tracking.

- Worked against a shared design system delivered as a versioned private npm package, keeping every screen on one component, theming and typography contract.
- Built the offline and caching layer with SWR and MMKV so catalogue data and lesson progress survive dropped connections, backgrounding and app restarts.
- Integrated video playback with progress analytics, in-app purchases, push messaging and Google Sign-In, and tuned list virtualisation for long study sessions.
- Delivered urgent fixes without waiting for store review using CodePush over-the-air updates, with Sentry for crash and regression monitoring.

Full-Stack Engineer

Bitpin | Remote | 2022 – 2024

Live cryptocurrency exchange (bitpin.ir), a crypto-payment shop (Paymoon) and two internal operations systems (Siba, Chortke).

- Built and maintained the React interfaces and Python services used to run trading, payments and back-office operations across four products.
- Kept high-churn market, order and balance screens correct under constant updates using React Query and Redux, where a stale render has a financial cost.
- Delivered Python services and APIs behind trading and administrative workflows, covering authentication, business rules and operational reporting.
- Diagnosed and fixed production incidents on a money-moving platform, following faults across the API and UI boundary rather than patching the symptom.

Full-Stack Engineer (contract)

SinanSoft | Remote, part-time | 2018 – Present

Telecom platform work plus a portfolio of web products and admin consoles.

- Build and maintain the CIP / UniVoIP telecom operator portal, now at release v5.53: React with Material UI and MUI X Premium data grids, Keycloak single sign-on, embedded Cube.js and Superset analytics, live updates over STOMP, translation workflow through Ilocize, and Sentry release tracking.
- Deliver the subscription side of the same platform as event-driven Kafka workflows: phone-number provisioning and porting, Microsoft Teams onboarding, billing reconciliation and fax services, each integrating carrier and vendor APIs.
- Delivered a portfolio of Next.js and React products: sinansoft.com, the SJI catalogue and admin console, LoanThem loan-management PWA, Centralive admin, and AIOP site and admin on Next.js with Tailwind CSS 4, Material UI and React Query.
- Built Know Yourself as a Django backend with a React Native client, owning both sides of the API contract.

Full-Stack Engineer

Arvand Avid | 2017 – 2018

- Built NestJS and GraphQL (Apollo) APIs with Redis caching behind three products: Lernito, the Iknito scientific-journal workflow manager and the Troweb headless CMS.
- Built the Next.js frontends for the same products with React Query, Material UI and Emotion, all querying one GraphQL surface instead of a bespoke endpoint per screen.

Full-Stack Engineer

Greenweb | 2011 – 2017

- Built and ran Chapiroos, a print-production, staffing and order-management system used daily by operations staff (PHP and MySQL, later React), and web systems for the hosting provider IranServer.

SELECTED PROJECTS

Faranama — Django, PostgreSQL and React admin — full-stack build

Dealertouch — React and shadcn/ui admin plus a React Native app on GraphQL and Redux Toolkit

KimdiShop — Next.js and Tailwind CSS storefront with a PrimeReact admin console

Neowshop — React Native client on Google Cloud services

Qbar, Trido, Crypto — React PWA and Next.js interactive publications

LANGUAGES

English — professional working proficiency · Persian — native
